

# Written evidence submission to the House of Commons Science and Technology Committee's inquiry on an ARPA style agency.

June 2020

## 1. Summary

Summary of Recommendations

The position should be made attractive enough to get the best candidates from across the world.

## 5. How the programme works

'The DARPA and the ARPA models are purely milestone driven. Because the end goal is not a paper. The end goal is a specific technology, and the most of the time the deliverable is hardware not a bunch of reports.'

Summary: The flexibility of the ARPA model allows certain parts of the process to be highly collaborative with the research community. The milestone focus when running programmes is necessary, but if not properly managed can have negative effects.

Recommendations:

- Inclusion of the community in selection setting for programme calls
- Highly rigorous internal processes for setting up calls and awarding funding
- Incentivisation of researcher collaboration, especially across sectors
- Clear communication during milestone setting, with a balance between ambition and flexibility
- Further work is needed to investigate if UK ARPA should stop/go milestones
- The bureaucratic management also needs to be excellent
- Diversity and inclusion should be built into the agency from the beginning
